

Introduction to Programming
COMP101
2025-26

Tutorial-03
Task

The initial request from a client for a programmable solution to a problem is often presented as a ‘rough statement’.

Although it gives a general idea of the problem domain, because it is in natural language it lacks identification of omissions, inconsistencies, ambiguities and uncertainties and can’t form the basis of a programmed solution.

Task:

You have been tasked to provide a program for a client who has submitted a rough statement:

‘Record and average student test scores’

Using input-process-output we can take it to a draft#2

“Each student takes three tests in a semester.

Input of three tests per student is via a terminal (VDU/keyboard).

Calculate final score for each student.

Output the test number, mean and the standard deviation”.

Don’t refine this to a Problem Specification (as in the tutorial notes).

Instead, make a list of what you still need to know:

i.e., if you were to meet the client, what questions would you ask to help you understand how you are going to program this?
